└ Introduction

We will look at the motor behaviour of the *Drosophila* larva during navigational motion, paying attention to which segments are used, in which order, etc.

We want to get some insight into the circuits that control this behaviour and the role of sensory feedback by quantifying the motor output at high resolution.

1. Ultimately: trace out full pathway sensory *to* decision *to* motor
2. future: interfere, now: just look at normal behaviour

[Hertweck (1931)]

$\sim 10^4$ neurons.

Has CNS, spiking neurons,...

Many genetic tools.

Transparent \implies optogenetics.

└─ Navigation and locomotion

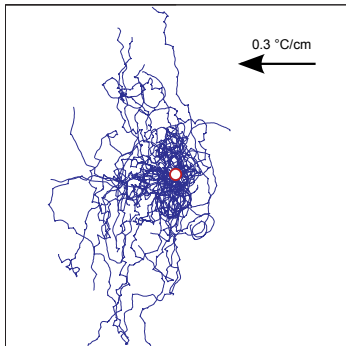

Section 1

Navigation and locomotion

Section 1

Navigation and locomotion

Biased random walks

Alternating runs and reorientations.

Effectively point-like sensor.

Similar to *E. coli* and *C. elegans*.

2011-12-13

Motor programs in *Drosophila* larvae

Navigation and locomotion

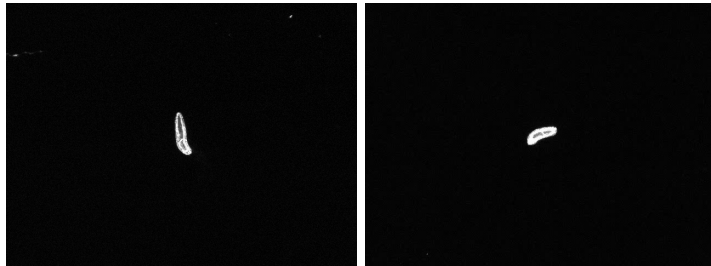

Biased random walks

Alternating runs and reorientations.
Effectively point-like sensor.
Similar to *E. coli* and *C. elegans*.

1. longer runs in good directions
2. has to move sensor to measure gradients
3. can do more
4. the thing that allows *D. larvae* to do more...

Head-sweeps

Moves head from side-to-side to sample environment and pick a direction to travel.

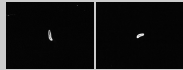

2011-12-13

Motor programs in *Drosophila* larvae

└ Navigation and locomotion

└ Head-sweeps

Head-sweeps

Moves head from side-to-side to sample environment and pick a direction to travel.

1. accepted
2. rejected

For thermo-/chemo-/photo-taxis, larva modulates:

- head-sweep frequency
- head-sweep size
- head-sweep acceptance probability

Depending on whether conditions are improving/worsening.

[Luo et al. (2010)]

1. turns more when things are getting worse
2. larger turns when things are getting worse
3. more likely to accept when better

- Different circuits?
- When is decision made? With what info?
- Mechano-sensory feedback?

Different types of head-sweep:

- Different circuits?
- When is decision made? With what info?
- Mechano-sensory feedback?

Look for differences in mechanics of different types of head-sweep.

1. difference in initiation → makes decision before

Locomotion and sensory feedback

Crawl using peristaltic waves from posterior to anterior that lift and push the body forwards.

Several types of Multidendritic (md) sensory neurons.
Repeated in each segment. Possibly used for proprioception.

[Bodmer and Jan (1987), Grueber et al. (2002)]

md neurons are used for locomotion:

- Turn off all types → no locomotion [Song et al. (2007)]
- Turn off certain subsets → disrupt pattern (toothpasting)

[Hughes and Thomas (2007)]

2011-12-13

md neurons are used for locomotion:

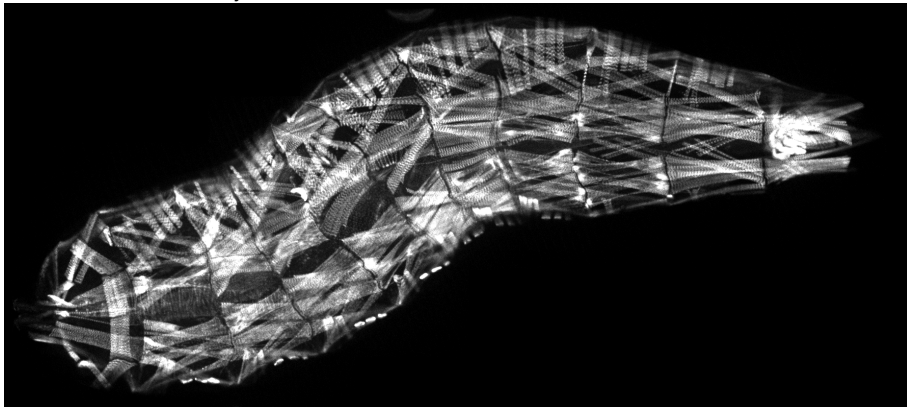

- Turn off all types → no locomotion (Song et al. (2007))
- Turn off certain subsets → disrupt pattern (toothpasting) (Hughes and Thomas (2007))

Imaging and analysis of fluorescent muscles

Fluorescent muscles

Mutant: $w^{-}; \frac{mhc-GFP^{0110}}{CyO}$

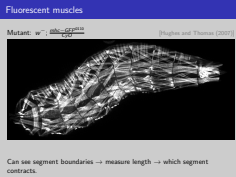

[Hughes and Thomas (2007)]

Can see segment boundaries → measure length → which segment contracts.

2011-12-13

- Motor programs in Drosophila larvae
 - Imaging and analysis of fluorescent muscles
 - Fluorescent muscles

1. we see 11 segments, some people talk about A9 (terminal, too small), mouth segment (involute during early development)
2. can't automate this yet.

Intensity pattern

Muscles contract \rightarrow same GFP in smaller volume \rightarrow increase concentration \rightarrow increase brightness.

2011-12-13

Motor programs in *Drosophila* larvae
└ Imaging and analysis of fluorescent muscles
└ Intensity pattern

Intensity pattern

Muscles contract \rightarrow same GFP in smaller volume \rightarrow increase concentration \rightarrow increase brightness.

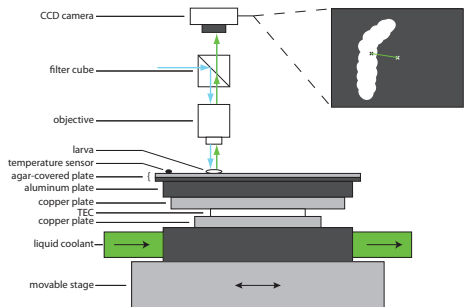

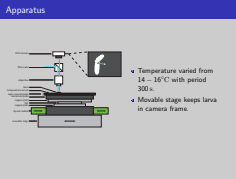

1. another measure of contraction. less noisy

2011-12-13

Motor programs in *Drosophila* larvae

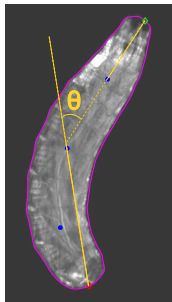

Imaging and analysis of fluorescent muscles

Apparatus

- Temperature varied from 14 – 16°C with period 300 s.
- Movable stage keeps larva in camera frame.

1. triggers many head-sweeps
2. allows comparison of head-sweep in warming/cooling

Find boundary, head, tail and bend angle automatically

2011-12-13

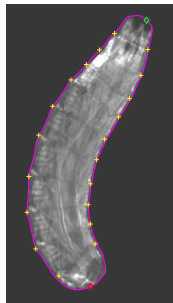

Motor programs in *Drosophila* larvae
└ Imaging and analysis of fluorescent muscles
└ Image analysis

Image analysis

Find boundary, head, tail and bend angle automatically

1. allows us to flag interesting bits
2. slowest part
3. automatic again. look for asymmetry
4. less noisy

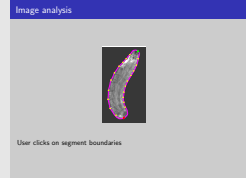

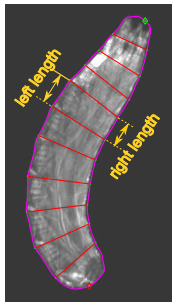

User clicks on segment boundaries

Results

Forward motion

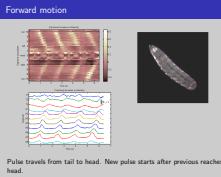

Pulse travels from tail to head. New pulse starts after previous reaches head.

2011-12-13

Motor programs in Drosophila larvae

Results

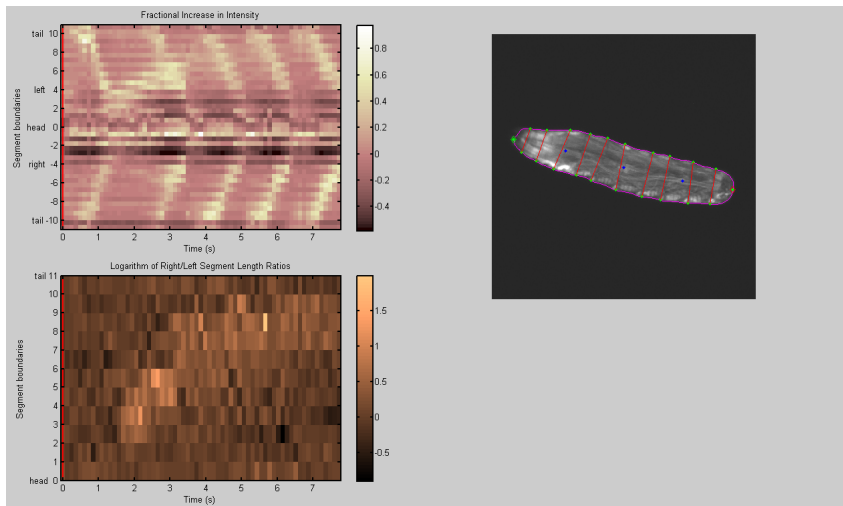

Forward motion

Pulse travels from tail to head. New pulse starts after previous reaches head.

1. Mouth hooks drown out all else (ratio) in T1,T2.
2. If we interfere with sensory feedback, could use this to measure effects.

Small accepted head-sweep

Basic pattern: Kink starts around (T3,A1,A2) and propagates back.
Subsequent peristalsis starts before kink reaches tail.

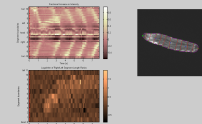

2011-12-13

Motor programs in *Drosophila* larvae

Results

Small accepted head-sweep

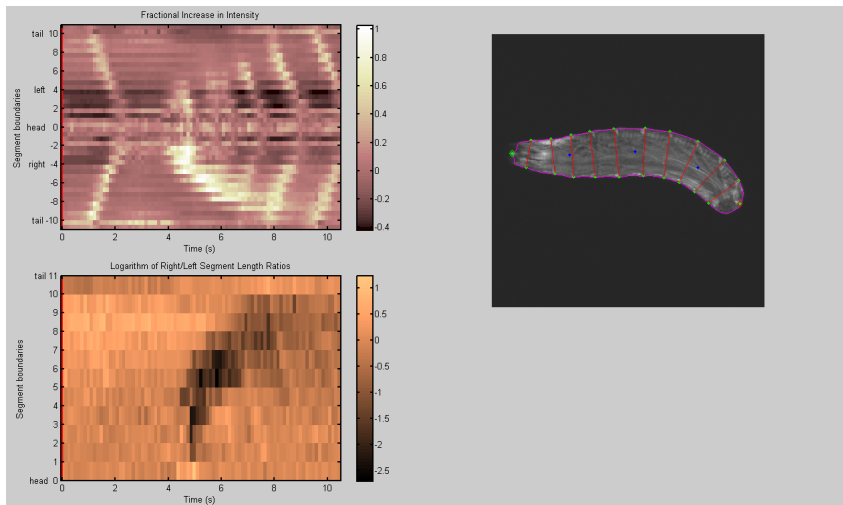

Small accepted head-sweep

Basic pattern: Kink starts around (T3,A1,A2) and propagates back.
Subsequent peristalsis starts before kink reaches tail.

1. Completes head-sweep with peristalsis, not unbending.
2. non-overlapping

Large accepted head-sweep

Basic pattern: Kink starts around (T3,A1,A2) and propagates back.
Subsequent peristalsis starts from kink, **not** tail.

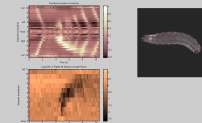

2011-12-13

Motor programs in *Drosophila* larvae

Results

Large accepted head-sweep

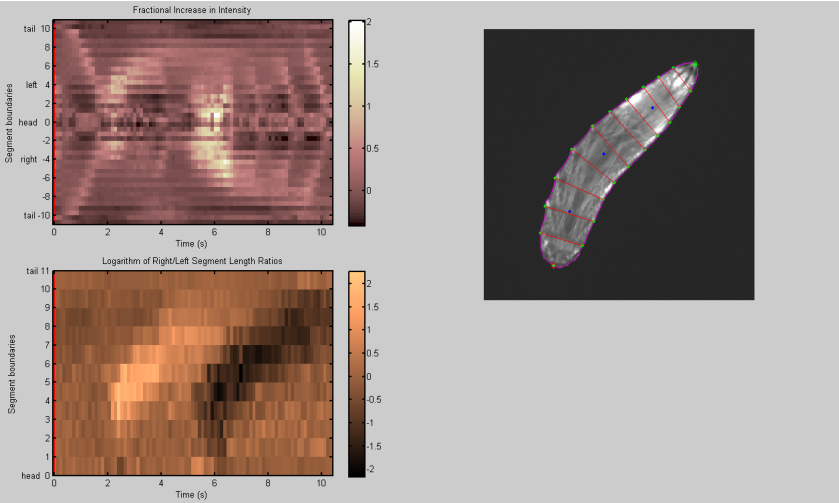

Large accepted head-sweep

Basic pattern: Kink starts around (T3,A1,A2) and propagates back.
Subsequent peristalsis starts from kink, **not** tail.

1. same as small, statistics later

Rejected head-sweep

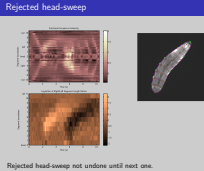

Rejected head-sweep not undone until next one.

2011-12-13

Motor programs in Drosophila larvae

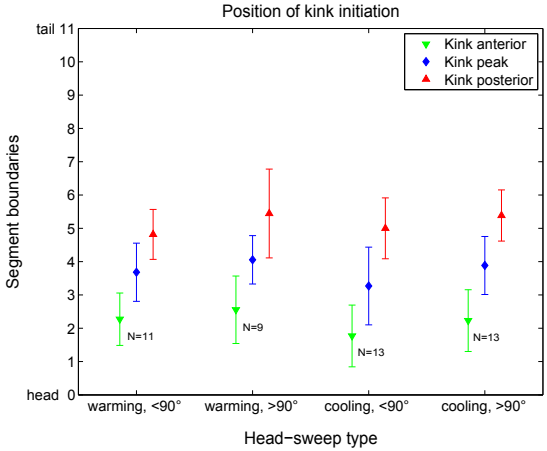

Results

Rejected head-sweep

1. no unbending program

Position of initial bend

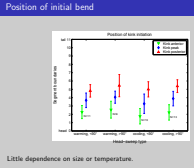

Little dependence on size or temperature.

2011-12-13

Motor programs in Drosophila larvae

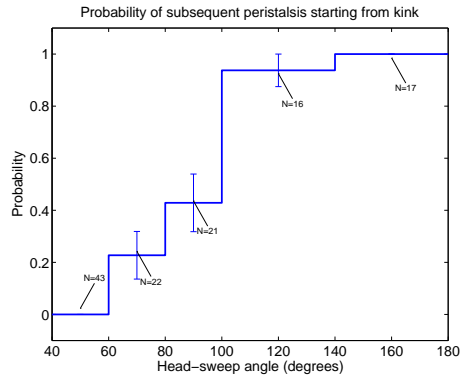

- Results
 - Position of initial bend

Little dependence on size or temperature.

- error bars ar std dev, not std err.

Position of start of peristalsis

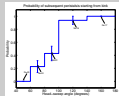

- Transition is around $90 - 100^\circ$.
- Varies from animal to animal.
- Not fully determined by angle.

2011-12-13

Motor programs in *Drosophila* larvae

Results

Position of start of peristalsis

- Transition is around $90 - 100^\circ$.
- Varies from animal to animal.
- Not fully determined by angle.

Possible explanations

- Mechanical reason?
 - > 90° tail would move wrong way.
 - < 90° starting from kink would be slower.
- Neural circuit?

Stretch-sensors involved in locomotion pattern. If one side is already contracted, segment just anterior to kink might think peristaltic pulse has already reached it
- Central pattern generator?

Body re-coupling in mid-cycle – dependence on head-sweep size?

2011-12-13

└ Conclusions and future directions

Section 4

Conclusions and future directions

Section 4

Conclusions and future directions

All head-sweeps start at the same segments. Same circuits? Decision on size of head-sweep made later?

Navigation results from combining two basic motor programs: peristalsis and asymmetric contraction. Pathway from sensory input → motor output simpler than previously thought.

No “unbending” motor program.

Large head-sweeps: subsequent peristalsis starts at kink. Shows that peristalsis can start anywhere. Implications for circuits that control forward motion.

2011-12-13

└─ Conclusions

Conclusions

All head-sweeps start at the same segments. Same circuits? Decision on size of head-sweep made later?

Navigation results from combining two basic motor programs: peristalsis and asymmetric contraction. Pathway from sensory input → motor output simpler than previously thought.

No “unbending” motor program.

Large head-sweeps: subsequent peristalsis starts at kink. Shows that peristalsis can start anywhere. Implications for circuits that control forward motion.

1. need to interfere with sensory input during head-sweep optogenetically.
2. only need to decide when to switch programs
3. can only reject by going other way.
4. peristalsis initiator not localised

Future directions

2011-12-13

- Motor programs in Drosophila larvae
 - Conclusions and future directions
 - Future directions

Future directions

Interfere with motor patterns (optogenetically).

Fully automate image analysis.

Other stimuli.

Reverse crawling, hunching, and rolling.

Interfere with motor patterns (optogenetically).

Fully automate image analysis.

Other stimuli.

Reverse crawling, hunching, and rolling.

1. requires next point
2. machine learning - training data
3. we did temperature, could do odour. light difficult. Unlikely to be any difference.
4. nociceptive and rapid avoidance responses
